- **Don't panic!**
- If you brought anything except your writing implements, your double-sided **handwritten** (in the original) 8½" × 11" cheat sheet, and your university ID, please put it away for the duration of the exam. In particular, please turn off and put away *all* medically unnecessary electronic devices.
- **Best answer.** Choose best possible choice if multiple options seems correct to you – for algorithms, faster is always better.
- Please ask for clarification if any question is unclear.
- **This exam lasts 75 minutes.**
- Fill your answers in the Scantron form using a pencil. We also recommend you circle/mark your answer in the exam booklet.
- Do not fill more than one answer on the Scantron form - such answers would not be graded. Also, fill your answer once you are sure of your answer – erasing an answer might make the form unscannable.
- **Good luck!**

### Before doing the exam...

- Fill your name and netid in the back of the Scantron form, and also on the top of this page.
- **Fill in the pattern shown on the right in the Scantron form.**

This encodes which version of the exam you are taking, so that we can grade it.

1. (2 points)

Given a directed graph with  $n$  vertices and  $m$  edges, and positive integer weights on the edges, deciding if there is a path between two vertices of weight exactly  $W$  is

- (A) Can be solved in polynomial time.
- (B) Can be solved in linear time.
- (C) None of the other answers.
- (D) Can be solved in the time it takes do Dijkstra in the graph.
- (E) NPC.

---

2. (2 points)

Let  $L$  be an instance of linear programming with  $n$  variables and 7 constraints. Computing the value of the optimal solution for such an LP can be solved in

- (A) Polynomial time.
- (B)  $O(n^n)$  time using the simplex algorithm.
- (C) This problem is NPC.

---

3. (2 points)

Consider a graph  $G$  over  $n$  vertices, with an ordering of the vertices  $v_1, v_2, \dots, v_n$ , such that  $v_i$  has at most  $k$  edges to  $\{v_1, \dots, v_{i-1}\}$ , for all  $i$ . We have that:

- (A)  $G$  has an independent set of size  $\geq n/(k+1)$
- (B)  $G$  can be colored using  $k+1$  colors.
- (C) All of the other answers are correct.
- (D)  $G$  has at most  $kn$  edges.

---

4. (2 points)

Consider a random variable  $X_i$ , where  $X_0 = n$ , and  $\mathbb{E}[X_i | X_{i-1}] = \lfloor X_{i-1}/4 \rfloor$ , for all  $i > 0$ . Let  $U$  be the first index such that  $X_U = 0$ . Consider the probability that  $\mathbb{P}[U \geq \lceil \log_2 n \rceil]$ . This probability is bounded by (the smaller the upper bound, the better):

- (A)  $1/n^3$ .
- (B)  $1/2$ .
- (C)  $1/n^2$ .
- (D)  $1/n^{40}$ .
- (E)  $1/n$ .

---

5. (2 points)

Given an algorithm that can compute a 4-coloring of a graph (if such a coloring exists) in polynomial time, would imply that

- (A) All the problems that are **NPC** can be solved in polynomial time.
  - (B) All the problems in **NP** can be solved in polynomial time.
  - (C) None of the other answers.
- 

6. (2 points)

Let  $G$  be an integral instance of network flow, with  $n$  vertices and  $m$  edges. Let  $t$  be the sink, and let  $K$  be the value of the maximum flow in  $G$ . Let  $\mu$  be a parameter. Deciding if there is a maximum flow in  $G$  of value  $K$  that uses only  $\mu$  edges coming into  $t$  (i.e., all the other edges into  $t$  have zero flow on them) is

- (A) **NPC**.
  - (B) Can be done in polynomial time using maximum flow.
- 

7. (2 points)

Consider  $k$ -CNF formula  $E$  over  $n$  variables, and with  $2n$  clauses. Here, every clause has exactly  $k$  literals (which are all distinct variables). Consider the case that  $k \geq 4 \lceil \lg n \rceil$ . We have that

- (A)  $E$  might not have a satisfying assignment.
  - (B) deciding if there is a satisfying assignment for  $E$  is **NPC**.
  - (C)  $E$  always has a satisfying assignment.
- 

8. (2 points)

You are given an undirected graph  $G$  with  $n$  vertices and  $m$  edges. Assume that the min-cut in this graph is of size  $k > 1$ . Which of the following statements is correct.

- (A) The max-flow in  $G$  is of value  $k$ .
  - (B) For any pair of vertices  $u, v$  in  $G$ , there are at least  $k$  edge disjoint paths that connect  $u$  to  $v$ .
  - (C) Any two vertices in  $G$  are on a simple cycle.
- 

9. (2 points)

Let  $G$  be an instance of network flow with all capacities being rational numbers. Then, the Ford-Fulkerson method would always stop and compute the maximum flow in  $G$ . This statement is

- (A) False.
- (B) True.

---

**10.** (2 points)

Let  $G$  be a graph with a min cut of size  $k \geq 1$ .

- (A) The graph  $G$  does not necessarily has a spanning tree.
  - (B) The graph  $G$  has at least  $k$  edge disjoint spanning trees, and no stronger statement can be made.
  - (C) The graph  $G$  has at least one spanning tree, and no stronger statement can be made.
- 

**11.** (2 points)

Let  $X$  be a set of  $n$  distinct numbers in  $[0, 1]$ . Let  $x_1, \dots, x_k$  be  $k$  numbers of  $X$ . Computing the rank of each of the  $x_i$ , for  $i = 1, \dots, k$ , can be done in time (faster is better):

- (A)  $O(k)$ .
  - (B)  $O(n \log n + k \log n)$ .
  - (C)  $O(n \log k)$ .
  - (D)  $O(k \log n)$ .
  - (E)  $O(nk)$ .
- 

**12.** (2 points)

Let  $G$  be an undirected graph with  $n > 1$  vertices and  $m > 1$  edges. Let  $M$  be a matching in  $G$ , such that any augmenting path for  $M$  has length at most  $2k + 1$ . Let  $\text{opt}$  be the maximum matching in  $G$ . We have that :

- (A)  $|M| \leq (1 - 1/(4k + 1)) |\text{opt}|$ .
  - (B)  $|M| \geq (1 - 1/(4k + 1)) |\text{opt}|$ .
  - (C)  $|M| \geq (1 - 1/(k + 1)) |\text{opt}|$ .
  - (D)  $|M| \leq (1 - 1/(k + 1)) |\text{opt}|$ .
  - (E) None of the other answers are correct.
- 

**13.** (2 points)

Consider an unweighted graph  $G$  with diameter  $\Delta > 1$  (i.e., the shortest path between any pair of vertices of  $G$  is at most  $\Delta$ , and there is a pair with this distance). There must be an independent set in  $G$  of size at least (bigger is better)

- (A)  $\Delta^2$
- (B)  $\Delta$
- (C)  $n/\Delta^2$
- (D)  $\lfloor n/(1 + \Delta) \rfloor$
- (E)  $\lceil (\Delta + 1)/2 \rceil$ .

---

**14.** (2 points)

Consider a randomized algorithm that in the  $i$ th iteration, with probability  $1/i^2$  has to perform  $O(i^2)$  work, and otherwise it performs  $O(\log i)$  work. The expected running time of this algorithm, over  $n$  iterations, is (smaller is better):

- (A)  $O(n \log n)$ .
  - (B)  $O(n^4)$ .
  - (C)  $O(n^3)$ .
  - (D)  $O(n^2)$ .
  - (E)  $O(n \log^2 n)$ .
- 

**15.** (2 points)

Consider a weighted instance of set cover  $(G, \mathcal{F})$  that is special – there are  $n$  elements in the ground set, and every element appears in at most  $t$  sets of  $\mathcal{F}$ , where  $t$  is some small integer positive constant. Here, each set in  $\mathcal{F}$  has an associated positive cost, and the purpose is to find a minimum cost collection of sets that covers  $G$ . Here, you can assume that LP can be solved in polynomial time. Which of the following statements is correct (a better approximation is better):

- (A) One can compute a  $t$  approximation in polynomial time.
  - (B) One can compute a  $O(\log t)$  approximation in polynomial time.
  - (C) One can compute a  $O(\log n)$  approximation in polynomial time.
  - (D) One can compute a  $t/2$  approximation in polynomial time.
- 

**16.** (2 points)

Let  $G$  be the complete graph with all the edges having weight either 1 or 2. Consider the problem of computing the cheapest simple cycle that goes through all the vertices of  $G$ . This problem can be

- (A) 2-approximated, in polynomial time, and one can not do better.
  - (B) solved exactly in  $O(n^2)$  time using matchings.
  - (C) solved exactly in polynomial time.
  - (D) solved exactly in  $O(n^3)$  time using network flow.
  - (E) 3/2-approximated, in polynomial time, and one can not do better.
- 

**17.** (2 points)

Let  $G$  be an instance of network flow with all capacities being integer numbers. Then, the maximum flow must assign integral flow to all the edges of  $G$ . This statement is

- (A) True.
- (B) False.
- (C) NPC.

---

**18.** (2 points)

Let  $L$  be an instance of linear programming with  $n$  variables and 7 constraints. Computing the value of the optimal solution for such an LP can be solved in

- (A) Polynomial time.
  - (B)  $O(n^n)$  time using the simplex algorithm.
  - (C) This problem is **NPC**.
- 

**19.** (2 points)

Let  $G$  be an undirected graph with  $n > 4$  vertices and  $m > 20n$  edges. Which of the following statements is correct:

- (A) There is a matching in  $G$  of size  $\Omega(m)$ .
  - (B) There is a matching in  $G$  of size  $\Omega(\sqrt{m})$ .
  - (C) There is a matching in  $G$  of size  $\geq n/2$ .
  - (D) There is a matching in  $G$  of size  $\geq 40\sqrt{m/n}$ .
  - (E) There is a matching in  $G$  of size  $\geq 10$ .
- 

**20.** (2 points)

Consider a weighted undirected graph  $G$  over  $n$  vertices, and let  $s$  be a vertex in  $G$ . Let  $v_1, v_2, \dots, v_n$  be a random permutation of the vertices. For any two vertices  $x, y \in V(G)$ , let  $d(x, y)$  denote the length of the shortest path in  $G$  between  $x$  and  $y$ . For  $i = 1, \dots, n$ , let  $n_i$  be the closest vertex to  $s$  in  $G$  among the vertices of  $V_i = \{v_1, \dots, v_i\}$  (i.e.,  $n_i = \arg \min_{v \in V_i} d(s, v)$ ). Similarly, let  $f_i = \arg \max_{v \in V_i} d(s, v)$  be the furthest neighbor in  $V_i$ , for all  $i$ . Let  $\ell_i = (d(s, n_i) + d(s, f_i))/2$ .

Assume that all the pairwise distances in the graph are unique.

- (A) All of the other answers are correct.
  - (B) The sequence  $\ell_1, \dots, \ell_n$  has  $\Theta(\log n)$  distinct values in expectation.
  - (C) The sequence  $\ell_1, \dots, \ell_n$  can have only 2 distinct values.
  - (D) The sequence  $\ell_1, \dots, \ell_n$  has  $O(\log^2 n)$  distinct values in expectation.
  - (E) The sequence  $\ell_1, \dots, \ell_n$  has  $\Theta(\log n)$  distinct values with high probability.
- 

**21.** (2 points)

Sorting  $n$  random numbers picked uniformly from  $[0, 1]$  can be done in time (faster is better):

- (A)  $O(n \log n)$ .
- (B)  $O(n)$ .
- (C)  $O(n \log \log n)$ .
- (D) why knows?

---

**22.** (2 points)

Let  $G$  be an undirected graph over  $n$  vertices. Which of the following statements is correct:

- (A) There is always a (simple) path in  $G$  of length  $\lfloor \sqrt{n} \rfloor$ , or alternatively there is an independent set in  $G$  of size  $\lfloor \sqrt{n} \rfloor$ .
- (B) None of the other answers are correct.
- (C) There is always a clique in  $G$  of size  $\lfloor \log n \rfloor$ , or alternatively there is an independent set in  $G$  of size  $\lfloor \sqrt{n} \rfloor$ .

---

**23.** (2 points)

Given a set  $X$  of  $n$  numbers, and an array  $T$  of size  $n^2$ . Let  $\mathcal{H}$  be a 2-universal family of hash functions into  $T$ . A hash function  $h$  is good, if no two elements of  $X$  collide when mapped by  $h$  into  $T$ . We have that

- (A) All the functions in  $\mathcal{H}$  are good.
- (B) When 2-universal family of functions sends its functions, they are not sending their best. They are bringing collisions. They are mixing values. They are bad. And some, I assume, are good functions.
- (C) There is not necessarily any good function in  $\mathcal{H}$  because of the birthday paradox.
- (D) There is at least one good function in  $\mathcal{H}$ .
- (E) At least half the functions in  $\mathcal{H}$  are good.

---

**24.** (2 points)

Let  $X$  be a set of  $n$  distinct numbers in  $[0, 1]$ . You are given an oracle that can, in  $O(\log n)$  time, answer the following two queries:

- (A) Given parameters  $\alpha \leq \beta$ , the oracle returns how many elements of  $X$  are in the interval  $[\alpha, \beta]$ .
- (B) Given parameters  $\alpha \leq \beta$ , the oracle returns a random number in  $X$  that lies in the interval  $[\alpha, \beta]$  (the random number is chosen uniformly among all such numbers).

Computing the median of  $X$  can be done in expected time (faster is better):

- (A)  $O(n)$ .
- (B)  $O(\log^2 n)$ .
- (C)  $O(1)$ .
- (D)  $O(\log^3 n)$ .
- (E)  $O(\log n)$ .

---

**25.** (2 points)

Let  $I$  be an instance of network flow, defined over a graph with  $n$  vertices and  $m$  edges. Let  $L$  be the LP modeling the network-flow. The LP  $L$  can be solved in time  $T$ . Up to constant factors, we have:

- (A) The time  $T$  is (asymptotically) more than it takes to solve network flow, but less than the time it takes solve a general LP with this number of variables and constraints.
- (B)  $T =$  Time it takes to solve network flow of this size.
- (C)  $T =$  Time it takes to solve a general LP with this number of constraints and variables, and not faster.

---

**26.** (2 points)

In the shortest-path with colors problem, you are given a weighted undirected graph  $G$ , a start vertex  $s$ , an end vertex  $t$ , and a list of  $k$  colors  $c_1, \dots, c_k$  that you need to pick. Every vertex has an associated color. A path  $\pi = v_1, v_2, \dots, v_t$  from  $s$  to  $t$  is **valid** if, for any  $i$ ,  $1 \leq i \leq k$ , the color  $c_i$  appears in some location  $\ell_i$  (i.e., the color of  $v_{\ell_i}$  is  $c_i$ ). Furthermore,  $\ell_1 < \ell_2 < \dots < \ell_k$ . The task is to compute the shortest path (not necessarily simple) of this type.

This problem is

- (A) Solvable in  $O(k(n \log n + m))$  time.
- (B) This version is **NP-HARD**, and the version where you just have to pick all the colors (but the order does not matter) is also **NP-HARD**.
- (C) Solvable in  $O(n^3)$  time, and no faster algorithm is possible.
- (D) **NP-HARD**.
- (E) Solvable in  $O(n \log n + m)$  time, and no faster algorithm is possible.

---

**27.** (2 points)

Given an unweighted undirected graph  $G$ , and parameters  $k$  and  $r$ , consider the problem of deciding if there is a set  $S$  of  $k$  vertices in  $G$ , such that all vertices in  $G$  are in distance at most  $r$  from some vertex of  $S$ . Which of the following statements is false.

- (A) This problem is **NPC** even if the graph is a tree.
- (B) This problem can be solved in polynomial time for  $r \geq n/10$ .
- (C) If there is such a set, then one can compute efficiently a set  $S'$  that has the same property, but with distance  $2r$ .
- (D) This problem is **NPC** even for  $r = 1$ .

---

**28.** (2 points)

Let  $X$  be some optimization problem (e.g., coloring). You are given a reduction **improve** that takes any polynomial time  $\alpha$ -approximation algorithm to  $X$ , for any  $\alpha > 1$ , and generates a new polynomial time approximation algorithm, with the quality of approximation being improved to  $1 + 1/(\alpha - 1)$ . You are given a polynomial time  $\beta$ -approximation algorithm to  $X$ , where  $\beta > 1$ . As such, we have the following:

- (A)  $X$  is **NP-HARD** to approximate within a constant factor.
- (B) one can compute an  $O(\log^* n)$ -approximation to  $X$  in polynomial time, and no better approximation is possible.
- (C) one can compute an 2-approximation to  $X$  in polynomial time, and no better approximation is possible.
- (D) one can compute an  $O(\log \log \log n)$ -approximation to  $X$  in polynomial time, and no better approximation is possible.
- (E) one can compute an  $(1 + \varepsilon)$ -approximation to  $X$  in polynomial time, for any constant  $\varepsilon \in (0, 1)$ .

---

**29.** (2 points)

You are given an undirected graph (with multiplicities on the edges)  $G$  with  $n$  vertices and  $m$  edges. Furthermore, assume you are given an oracle, such that given an input graph  $G$ , it returns you an edge that is not in some min-cut of  $G$  (this takes constant time), if such an edge exists. Given such an oracle, one can compute the min-cut in the graph in time (faster is better):

- (A)  $O(n^3)$ .
- (B)  $O(n \log^2 n)$ .
- (C)  $O(m \log n)$ .
- (D)  $O(n)$ .
- (E)  $O(n^4)$ .

---

**30.** (2 points)

Consider an input  $X \equiv x_1, \dots, x_n$  of  $n$  numbers, and let  $k$  be a parameter (which is relatively small compared to  $n$ ). Let  $Y$  be the sequence  $X$  after it is being sorted. Assume that every number in  $X$  is at most  $k$  locations away from its location in  $Y$ . The sorted list  $Y$  can be computed by a sorting network of depth (smaller is better):

- (A)  $O(k)$ .
- (B)  $O(n)$ .
- (C)  $O(\log^2 k)$ .
- (D)  $O(n \log n)$ .
- (E)  $O(\log^2 n)$ .

---

**31.** (2 points)

You are given a stream  $S$  of  $n$  numbers, and space  $s = \Omega(n^c)$ , where  $c \in (0, 1)$  is a constant, one can compute the median of  $S$  by reading the stream (smaller is better):

- (A)  $O(\sqrt{n})$  times.
- (B)  $O(1/c)$  times.
- (C)  $O(n^{1/c})$  times.
- (D)  $O(n^c)$  times.
- (E)  $O(\log^2 n)$  times.

---

**32.** (2 points)

There are known sorting networks that sort all binary strings correctly except for one string (yeh, wow). You are given a sorting network  $N$ , with  $n$  inputs and  $m$  gates, and parameters  $\delta \in (0, 1)$  and  $\varepsilon \in (0, 1)$ . Verifying that  $N$  works correctly on a specific input can be done in  $O(n + m)$  time. You want an algorithm that either finds an input for which  $N$  is wrong, or alternatively, the number of inputs for which  $N$  is wrong is at most  $\delta 2^n$  (out of the  $2^n$  possible binary inputs). An algorithm that makes such a decision, and is correct with probability at least  $1 - \varepsilon$ , runs in (faster is better):

- (A)  $O((n + m)\delta 2^n / \varepsilon)$ .
- (B)  $O(\log^2((n + m)/\delta\varepsilon))$ .
- (C)  $O((n + m)^{\frac{1}{\delta}} \log \frac{1}{\varepsilon})$ .
- (D)  $O((n + m)\delta 2^m \log \frac{1}{\varepsilon})$ .
- (E)  $O((n + m)/(\delta\varepsilon))$ .

---

**33.** (2 points)

Consider the problem of given two strings  $s_1, s_2$  of total length  $n$ , computing the shortest string  $T$  that contains both strings. Here  $T$  contains  $s_i$ , if one can delete characters in  $T$  to get  $s_i$ , for  $i = 1, 2$ . This problem can be solved in (faster is better):

- (A)  $O(n \log n)$ .
- (B)  $O(n^2)$ .
- (C)  $O(n)$ .
- (D)  $O(n^4)$ .
- (E)  $O(n^3)$ .

---

**34.** (2 points)

You are given two sets  $R, B$  of  $n$  points in  $\mathbb{R}^d$ , and consider the problem of computing a hyperplane that separates them (say, it passes through the origin). Let  $\Delta$  be the diameter of  $R \cup B$ , and let  $\ell = \min_{r \in R, b \in B} \|r - b\|$ . Which of the following statements is correct.

- (A) running time  $O(n^{\lfloor d/2 \rfloor})$  is possible, and no faster algorithm is possible.
  - (B) since the problem is equivalent to linear programming, and we do not know if there is a strongly polynomial time algorithm for LP, it follows that this can not be solved in polynomial time.
  - (C) running time  $O(n^{d+1})$  is possible, and no faster algorithm is possible.
  - (D) one can compute such a separating hyperplane in time polynomial in  $\Delta$  and  $1/\ell$ ,  $d$ , and  $n$ .
  - (E) the problem is **NP-HARD**.
- 

**35.** (2 points)

Given two sets  $R$  and  $B$  of  $n$  points in  $\mathbb{R}^3$ , one can decide if  $R$  can be separated from  $B$  in expected time (faster is better):

- (A)  $O(n)$ .
  - (B)  $O(n^3)$ .
  - (C)  $O(n^n)$ .
  - (D)  $O(n \log n)$ .
  - (E) None of other answers are correct.
- 

**36.** (2 points)

Let  $G$  be a directed graph with weights on the edges, which might be negative or positive. We have the following:

- (A) Computing the longest simple cycle in  $G$  is **NP-HARD**.
  - (B) Computing if there is a negative cycle in  $G$  can be done in polynomial time.
  - (C) Computing the shortest simple cycle in  $G$  is **NP-HARD**.
  - (D) All the other answers are correct.
- 

**37.** (2 points)

Given a set  $X$  of  $n$  positive *real* numbers, there is always a hashing scheme that requires  $O(1)$  time per operation, and can store  $X$  using  $O(n)$  space. This statement is

- (A) Incorrect.
- (B) Mostly correct.
- (C) correct.

---

**38.** (2 points)

Let  $L$  be an LP, and let  $L^*$  be its dual. Which of the following scenarios are possible:

- (A)  $L$  is not feasible and  $L^*$  is not feasible.
  - (B) It can be that  $L$  is feasible, and  $L^*$  is not.
  - (C) All four other cases are possible.
  - (D)  $L$  is feasible and  $L^*$  is feasible.
  - (E) It can be that  $L$  is infeasible, and  $L^*$  is feasible.
- 

**39.** (2 points)

Deciding if a 2SAT formula  $F$  with  $n$  variables and  $m$  clauses, is satisfiable can be done in (faster is better):

- (A)  $O((n + m)^2)$  time.
  - (B)  $O(n + m)$  time.
  - (C) None of the other answers.
  - (D)  $O(2^{n+m})$  time.
- 

**40.** (2 points)

Given a tree  $T$  with  $n$  vertices, computing the largest independent set in  $T$  can be done in time:

- (A)  $O(n^4)$ .
  - (B)  $O(n \log n)$ .
  - (C)  $O(n^3)$ .
  - (D)  $O(n^3)$ .
  - (E)  $O(n)$ .
- 

**41.** (2 points)

Let  $G$  be an instance of network flow, with  $n$  vertices and  $m$  edges (with all capacities being integers). Computing acyclic maximum flow in  $G$  is

- (A) NPC.
- (B) Doable in polynomial time.

---

Consider a graph  $G$  with  $n$  vertices and  $m$  edges. Let  $k$  be some positive integer number. A  $k$  multi-way cut, is a partition of the vertices of  $G$  into  $k$  sets  $(S_1, \dots, S_k)$ . An edge is in the cut, if its endpoints are in different sets of this partition.

- (A) There is always a multi-way cut with at least  $\sqrt{m/k}$  edges, and no stronger statement can be made
  - (B) There is always a multi-way cut with at least  $m/\sqrt{k}$  edges, and no stronger statement can be made
  - (C) There is always a multi-way cut with at least  $(1 - 1/k)m$  edges, and no stronger statement can be made.
  - (D) There is always a multi-way cut with at least  $m/2$  edges, and no stronger statement can be made
  - (E) There is always a multi-way cut with at least  $m/k$  edges, and no stronger statement can be made
-

Let  $P$  be a set of points in the plane, such that all pairwise distances are unique, and  $n = |P|$ . Let  $p_1, \dots, p_n$  be a random permutation of the points, and let  $\Delta_i = \max_{b < c \leq i} \|p_b - p_c\|$  be the diameter of  $p_1, \dots, p_i$ , for  $i = 2, \dots, n$ . Let  $\alpha_i = \mathbb{P}[\Delta_i \neq \Delta_{i-1}]$ . For  $i > 2$ , we have that

- (A)  $\alpha_i = 0$ .
  - (B)  $\alpha_i = 1/i$ .
  - (C)  $\alpha_i = 2/i$ .
  - (D)  $\alpha_i = 1 - 2/i$ .
  - (E)  $\alpha_i \leq 1 - 2/i$ .
-

Let  $G$  be an undirected graph with  $n$  vertices and  $m$  edges, that does not have an odd cycle. Then one can compute in linear time an independent set in  $G$  of size at least (bigger is better)

- (A)  $\sqrt{n}$ .
- (B)  $\Theta(\log n)$ .
- (C) None of the other answers are correct.
- (D)  $n$ .
- (E)  $\lceil n/2 \rceil$ .

---

**45.** (2 points)

Consider a given directed graph  $G$  with  $n$  vertices and  $m$  edges. A set of vertices  $S$  in  $G$  is influential, if for any vertex  $v \in V(G)$ , there is a vertex  $s \in S$ , such that there is a path in  $G$  from  $s$  to  $v$ . One can compute in polynomial time (under the assumption that  $P \neq NP$ ) an  $\alpha$ -approximation to the smallest influential set, where the value of  $\alpha$  is (smaller is better):

- (A)  $O(n)$
- (B)  $O(\log \log n)$
- (C)  $O(\log n)$
- (D) 2
- (E)  $O(\log^* n)$

---

**46.** (2 points)

Given a graph  $G$  with  $n$  vertices and  $m$  edges, computing a vertex cover in  $G$ , of size  $2k$ , if there is such a cover of size  $k$ , can be done in time (faster is better):

- (A)  $O(n)$
- (B)  $O(k^{m+n}(n+m))$
- (C)  $O(m)$
- (D)  $O(n^k(n+m))$
- (E)  $O(2^{2k}(n+m))$

You are given an algorithm `alg` for an  $NP$  problem  $X$ , which is a polynomial time certifier/verifier. Furthermore, assume that any positive instance of  $X$  has a certificate of length  $O(\log n)$ . Then, we have that

- (A)  $X$  is  $NPC$ .
- (B)  $X$  can be solved in polynomial time.
- (C) None of the other answers.
- (D) If  $X$  is  $NPC$ , then all the problems in  $NP$  have  $O(\log n)$  certificate.

Let  $X, Y, Z$  be three sets of distinct numbers such that  $X, Y, Z \subseteq \{1, 2, \dots, n\}$ . Consider the problem of deciding if for all  $z \in Z$ , there exists  $x \in X$  and  $y \in Y$ , such that  $z = x + y$ . This problem can be solved in time (faster is better, naturally):

- (A)  $O(n \log n)$ .
- (B)  $O(n^2 \log n)$ .
- (C)  $O(n)$ .
- (D)  $O(n^2 \log^2 n)$ .
- (E)  $O(n^2)$ .

---

Let  $G$  be an undirected unweighted graph with  $n > 1$  vertices and  $m > 1$  edges. A *minimal cycle* is a cycle in  $G$  such that no proper subset of its vertices form a cycle in  $G$ . How fast can one compute a minimal cycle?

- (A)  $O(nm^2)$ .
- (B)  $O(n \log n + m)$ .
- (C)  $O(nm)$ .
- (D)  $O(n + m)$ .
- (E)  $O((n + m) \log n)$ .

Consider the problem of deciding if a graph has a set  $X$  of  $k$  edges, such that each vertex is adjacent to an edge in  $X$ . This problem is:

- (A) A variant of 3SAT, and it is **NPC**.
- (B) A variant of Vertex Cover, and it is **NPC**.
- (C) A variant of 2SAT, and it is solvable in linear time.
- (D) solvable in polynomial time.
