Who could vote in the first elections in the US

Clicker question

1. Everybody.
2. White people.
3. White male people, that owned land or had taxable income.
4. Males.
5. Only people that looked like George Washington.

24.1: Model of Computation

Model of Computation

1. Q: Perform a computational task considerably faster by using a different architecture? *Yep.*
2. *Spaghetti sort!*

Pastafarianism

Spaghetti

Spaghetti

Spaghetti

The spaghetti tree hoax was a three-minute hoax report broadcast on April Fools' Day 1957 by the BBC current-affairs programme Panorama, purportedly showing a family in southern Switzerland harvesting spaghetti from the family "spaghetti tree". At the time spaghetti was relatively little-known in the UK, so that many Britons were unaware that spaghetti is made from wheat flour and water; a number of viewers afterwards contacted the BBC for advice on growing their own spaghetti trees. Decades later CNN called this broadcast "the biggest hoax that any reputable news establishment

Spaghetti sort

1. Input: $S = \{s_1, \dots, s_n\} \subseteq [1, 2]$.
2. Have much Spaghetti (this are longish and very narrow tubes of pasta).
3. cut i th piece to be of length s_i , for $i = 1, \dots, n$.
4. take all these pieces of pasta in your hand..
5. make them stand up vertically, with their bottom end lying on a horizontal surface
6. lower your handle till it hit the first (i.e., tallest) piece of pasta.
7. Take it out, measure it height, write down its number
8. and continue in this fashion till done.
9. Linear time sorting algorithm

7. Take it out, measure it height, write down its number
8. and continue in this fashion till done.
9. Linear time sorting algorithm

What is going on?

1. Faster algorithm achieved by changing the computation model.
2. allowed new “strange” operations
(cutting a piece of pasta into a certain length, picking the longest one in constant time, and measuring the length of a pasta piece in constant time)
3. Using these operations we can sort in linear time.
4. So, are there other useful computation models?

Circuits running time?

Clicker question

If any gate takes one unit of time to compute its value, and wires are instantaneous, then the above circuit takes how many units of time to compute its result?

1. 8
2. 4
3. 3
4. 2

Circuits are fast...

1. Computing the following circuit naively takes

8 units of time.

2. Use parallelism!
3. Circuits are really parallel...
4. Sorting numbers with circuits?
5. Q: Can sort in *sublinear* time by allowing parallel comparisons?

Circuits are fast...

1. Computing the following circuit naively takes

- 8** units of time.
2. Use parallelism!
3. Circuits are really parallel...
4. Sorting numbers with circuits?
5. Q: Can sort in *sublinear* time by allowing parallel comparisons?

Definitions

Definition

A **comparison network** is a **DAG**, with n inputs and n outputs, where each gate has two inputs and two outputs.

Definition

depth of a wire is **0** at input. For gate with two inputs of depth d_1 and d_2 the depth on the output wire is $1 + \max(d_1, d_2)$.

depth of comparison network is maximum depth of an output wire.

Definition

sorting network: comparison network such that for any inputs, the output is monotonically sorted.

Sorting network based on insertion sort

Lemma

The sorting network based on insertion sort has $O(n^2)$ gates, and requires $2n - 1$ time units to sort n numbers.

Sorting network based on insertion sort

(i)

(ii)

Lemma

The sorting network based on insertion sort has $O(n^2)$ gates, and requires $2n - 1$ time units to sort n numbers.

What is on the bottom wire?

Clicker question

The bottom wire in the circuit on the right would output the...

1. **min** of input numbers. Running time is **4**.
2. **max** of input numbers. Running time is **4**.
3. **min** of input numbers. Running time is **15**.
4. **max** of input numbers. Running time is **15**.
5. None of the above.

24.3: The Zero-One Principle

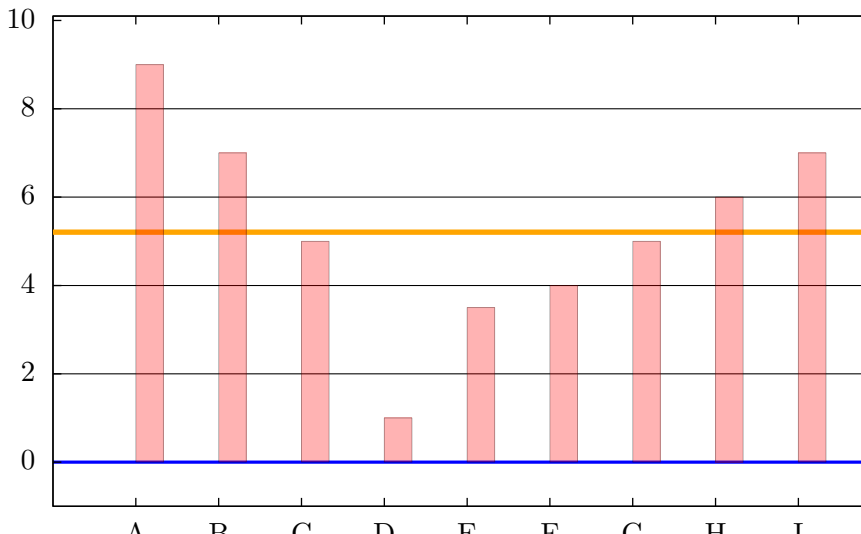

Converting a sequence into a binary sequence

Converting a sequence into a binary sequence

Converting a sequence into a binary sequence

Converting a sequence into a binary sequence

Converting a sequence into a binary sequence

24.3.1: The zero-one principle

The Zero-One Principle

Definition

zero-one principle states that if a comparison network sort correctly all binary inputs (\forall input is 0 or 1) then it sorts correctly all inputs (input is real number).

Need to prove the zero-one principle.

Lemma

A comparison network transforms input sequence

$$a = \langle a_1, a_2, \dots, a_n \rangle \implies b = \langle b_1, b_2, \dots, b_n \rangle$$

Then for any monotonically increasing function f , the network transforms

$$f(a) = \langle f(a_1), \dots, f(a_n) \rangle \implies f(b) = \langle f(b_1), \dots, f(b_n) \rangle$$

The Zero-One Principle

Definition

$$a = \langle a_1, a_2, \dots, a_n \rangle \implies b = \langle b_1, b_2, \dots, b_n \rangle$$

Then for any monotonically increasing function f , the network transforms

$$f(a) = \langle f(a_1), \dots, f(a_n) \rangle \implies f(b) = \langle f(b_1), \dots, f(b_n) \rangle$$

The Zero-One Principle

Definition

zero-one principle states that if a comparison network sort correctly all binary inputs (\forall input is 0 or 1) then it sorts correctly all inputs (input is real number).

Need to prove the zero-one principle.

Lemma

A comparison network transforms input sequence

$$\mathbf{a} = \langle a_1, a_2, \dots, a_n \rangle \implies \mathbf{b} = \langle b_1, b_2, \dots, b_n \rangle$$

Then for any monotonically increasing function f , the network transforms

$$f(\mathbf{a}) = \langle f(a_1), \dots, f(a_n) \rangle \implies f(\mathbf{b}) = \langle f(b_1), \dots, f(b_n) \rangle$$

Proof

1. Induction on number of comparators.
2. Consider a comparator with inputs x and y , and outputs $x' = \min(x, y)$ and $y' = \max(x, y)$.
3. If $f(x) = f(y)$ then the claim trivially holds.
4. If $f(x) < f(y)$ then clearly

$$\begin{aligned}\max(f(x), f(y)) &= f(\max(x, y)) \text{ and} \\ \min(f(x), f(y)) &= f(\min(x, y)),\end{aligned}$$

since $f(\cdot)$ is monotonically increasing.

5. $\langle x, y \rangle$, for $x < y$, we have output $\langle x, y \rangle$.
6. Input: $\langle f(x), f(y) \rangle \implies$ output is $\langle f(x), f(y) \rangle$.
7. Similarly, if $x > y$, the output is $\langle y, x \rangle$. In this case, for the input $\langle f(x), f(y) \rangle$ the output is $\langle f(y), f(x) \rangle$. This establishes the claim for a single

Now, the claim holds for the gate G itself.

24.3.1.1: Sorting correctly binary sequences implies real sorting

0/1 sorting implies real sorting

Theorem

If a comparison network with n inputs sorts all 2^n binary strings of length n correctly, then it sorts all sequences correctly.

Proof: 0/1 sorting implies real sorting

1. Assume for contradiction that fails for input a_1, \dots, a_n . Let b_1, \dots, b_n be the output sequence for this input.
2. Let $a_i < a_k$ be the two numbers that are output in incorrect order (i.e. a_k appears before a_i in output).
3.
$$f(x) = \begin{cases} 0 & x \leq a_i \\ 1 & x > a_i. \end{cases}$$
4. By lemma for input $\langle f(a_1), \dots, f(a_n) \rangle$, circuit would output $\langle f(b_1), \dots, f(b_n) \rangle$.
5. This sequence looks like:
000..0???? $f(a_k)$???? $f(a_i)$??1111
6. but $f(a_i) = 0$ and $f(a_j) = 1$. Namely, the output is a sequence of the form ?????1????0????, which

Proof: 0/1 sorting implies real sorting

1. Assume for contradiction that fails for input a_1, \dots, a_n . Let b_1, \dots, b_n be the output sequence for this input.

24.4: A bitonic sorting network

Bitonic sorting network

Definition

A **bitonic sequence** is a sequence which is first increasing and then decreasing, or can be circularly shifted to become so.

example

The sequences $(1, 2, 3, \pi, 4, 5, 4, 3, 2, 1)$ and $(4, 5, 4, 3, 2, 1, 1, 2, 3)$ are bitonic, while the sequence $(1, 2, 1, 2)$ is not bitonic.

Bitonic sorting network

A **bitonic sequence** is a sequence which is first increasing and then decreasing, or can be circularly shifted to become so.

example

The sequences $(1, 2, 3, \pi, 4, 5, 4, 3, 2, 1)$ and $(4, 5, 4, 3, 2, 1, 1, 2, 3)$ are bitonic, while the sequence $(1, 2, 1, 2)$ is not bitonic.

Bitonic sequences

Clicker question

(1)

(2)

(3)

(4)

1. All sequences above are bitonic.
2. None of the sequences above are bitonic.
3. (3) and (4) are bitonic, (1) and (2) are not.
4. (1) and (4) are bitonic, (2) and (3) are not.
5. (1), (3) and (4) are bitonic, (2) is not.

Binary bitonic sequences

Observation

binary bitonic sequence is either of the form $0^i 1^j 0^k$ or of the form $1^i 0^j 1^k$, where 0^i (resp, 1^i) denote a sequence of i zeros (resp., ones).

Bitonic sorting network

Definition

A ***bitonic sorter*** is a comparison network that sorts all bitonic sequences correctly.

Half cleaner...

Definition

half-cleaner: a comparison network, connecting line i with line $i + n/2$.

Half cleaner...

Definition

half-cleaner: a comparison network, connecting line i with line $i + n/2$.

Half cleaner...

Definition

half-cleaner: a comparison network, connecting line i with line $i + n/2$.

Half-Cleaner $[n]$ denote half-cleaner with n inputs.

Half cleaner...

Definition

half-cleaner: a comparison network, connecting line i with line $i + n/2$.

Half-Cleaner $[n]$ denote half-cleaner with n inputs.

Depth of **Half-Cleaner** $[n]$ is one.

Half cleaner on bitonic sequence...

1. What a half-cleaner do to an input which is a (binary) bitonic sequence?
2. In example... left half size is clean and all equal to 0.
3. Right side of the output is bitonic.
4. Specifically, one can prove by simple (but tedious)

Half cleaner on bitonic sequence...

1. What a half-cleaner do to an input which is a (binary) bitonic sequence?
2. In example... left half size is clean and all equal to **0**.
3. Right side of the output is bitonic.
4. Specifically, one can prove by simple (but tedious)

Half cleaner on bitonic sequence...

1. What a half-cleaner do to an input which is a (binary) bitonic sequence?

Half cleaner half sorts a bitonic sequence...

Lemma

If the input to a half-cleaner (of size n) is a binary bitonic sequence then for the output sequence we have that

- 1. the elements in the top half are smaller than the elements in bottom half, and*
- 2. one of the halves is clean, and the other is bitonic.*

Proof

Proof.

If the sequence is of the form $0^i 1^j 0^k$ and the block of ones is completely on the left side (i.e., its part of the first $n/2$ bits) or the right side, the claim trivially holds. So, assume that the block of ones starts at position $n/2 - \beta$ and ends at $n/2 + \alpha$.

If $n/2 - \alpha \geq \beta$ then this is exactly the case depicted above and claim holds. If $n/2 - \alpha < \beta$ then the second half is going to be all ones, as depicted on the

Bitonic sorter - sorts bitonic sequences...

- (i) recursive construction of **BitonicSorter**[n],
 (ii) opening up the recursive construction, and
 (iii) the resulting comparison network.

Bitonic sorter... the result

Lemma

BitonicSorter $[n]$ sorts bitonic sequences of length $n = 2^k$, it uses $(n/2)k = (n/2) \lg n$ gates, and it is of depth $k = \lg n$.

Making bitonic sequences?

Clicker question

$A = \langle a_1, \dots, a_n \rangle$: increasing sorted sequence.

$B = \langle b_1, \dots, b_n \rangle$: increasing sorted sequence.

Let $|$ the **concatenate** operator.

$\text{rev}(\langle x_1, \dots, x_m \rangle) = \langle x_m, x_{m-1}, \dots, x_1 \rangle$: **reverse** operator.

Then, we have that:

1. $A|B$ is a sorted sequence.
2. $A|\text{rev}(B)$ is a sorted sequence.
3. $A|B$ is a bitonic sequence.
4. $\text{rev}(\text{rev}(A)|\text{rev}(B))$ is a bitonic sequence.
5. $\text{rev}(A)|B$ is a bitonic sequence.

Merging sequence

1. Merging question: Given two *sorted* sequences of length $n/2$, how do we merge them into a single sorted sequence?
2. Concatenate the two sequences...
3. ... second sequence is being flipped (i.e., reversed).
4. Easy to verify that the resulting sequence is bitonic, and as such we can sort it using the **BitonicSorter**[n].
5. Given two sorted sequences $a_1 \leq a_2 \leq \dots \leq a_n$ and $b_1 \leq b_2 \leq \dots \leq b_n$, observe that the sequence $a_1, a_2, \dots, a_n, b_n, b_{n-1}, b_{n-2}, \dots, b_2, b_1$ is

Merger[n]: Using a bitonic sorter

Merging two sorted sequences into a sorted sequence

- (i) **Merger** via flipping the lines of bitonic sorter.
- (ii) **BitonicSorter**.
- (iii) **Merger** after we “physically” flip the lines.
- (iv) Equivalent drawing of the resulting **Merger**.

Merger[n] described using

(i)

(ii)

(i) **FlipCleaner**[n], and

(ii) **Merger**[n] described using **FlipCleaner**.

What **Merger**[n] does...

Lemma

*The circuit **Merger**[n] gets as input two sorted sequences of length $n/2 = 2^{k-1}$, it uses $(n/2)k = (n/2) \lg n$ gates, and it is of depth $k = \lg n$, and it outputs a sorted sequence.*

24.5: Sorting Network

Sorting Network

Finally...

Implement *merge sort* using **Merger** $[n]$.

Sorter $[n]$:

Lemma

The circuit **Sorter** $[n]$ is a sorting network (i.e., it sorts any n numbers) using $G(n) = O(n \log^2 n)$ gates. It has depth $O(\log^2 n)$. Namely, **Sorter** $[n]$ sorts n

Proof

Proof.

The number of gates is

$$G(n) = 2G(n/2) + \text{Gates}(\text{Merger}[n]).$$

Which is

$$G(n) = 2G(n/2) + O(n \log n) = O(n \log^2 n).$$

As for the depth, we have that

$$D(n) = D(n/2) + \text{Depth}(\text{Merger}[n]) = D(n/2) + O(\log(n)), \text{ and thus } D(n) = O(\log^2 n),$$

as claimed. □

Resulting sorted

Figure: **Sorter**[8].

24.6: Faster sorting networks

Faster sorting networks

1. Known: sorting network of logarithmic depth **Ajtai et al. [1983]**.
2. Known as the ***AKS sorting network***.
3. Construction is complicated.
4. **Ajtai et al. [1983]** is better than bitonic sort for n larger than 2^{8046} .
