- Motivation : Insect IoT
- Communication
- Localization
- Limitations and Evaluation

Insect IoT: Motivation

(Video)

- battery free flying.
- ubiquitous.

new sensory capabilities.

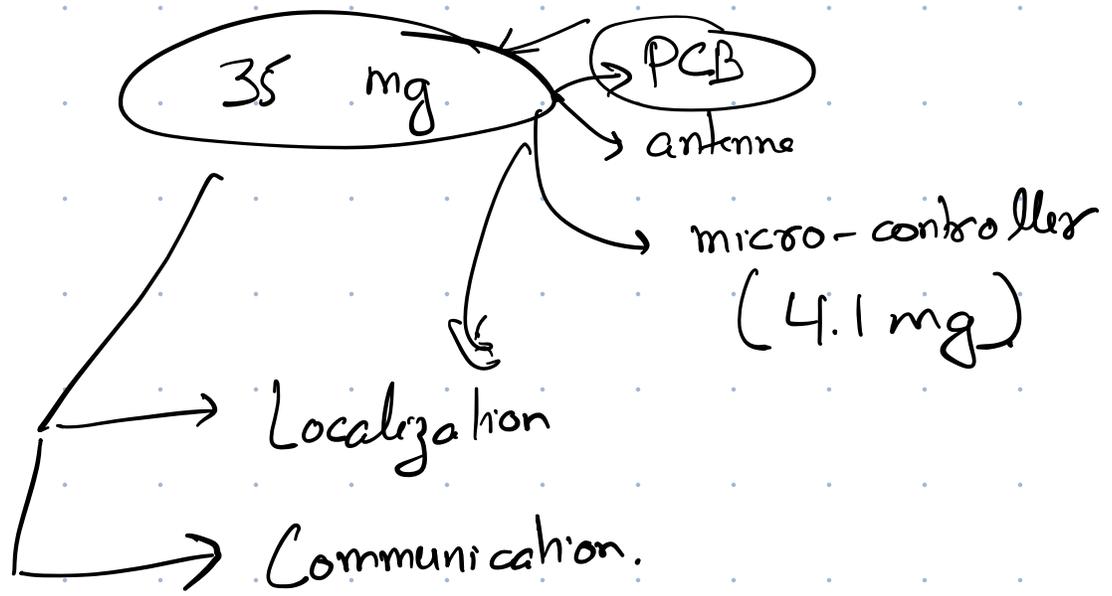

Budget

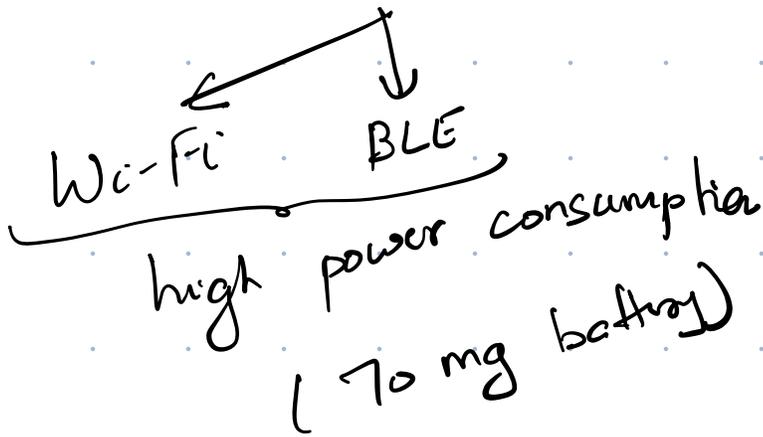

Weight budgets.
(105 mg)

70 mg ← battery

Communication

Get data from these sensors

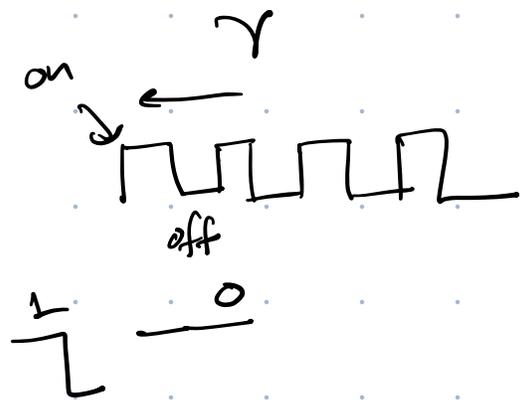

Backscatter ← really low power.

Range ↓

on-off keying

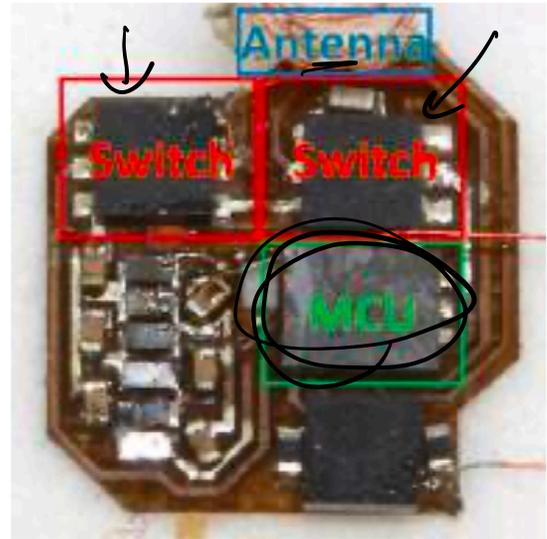

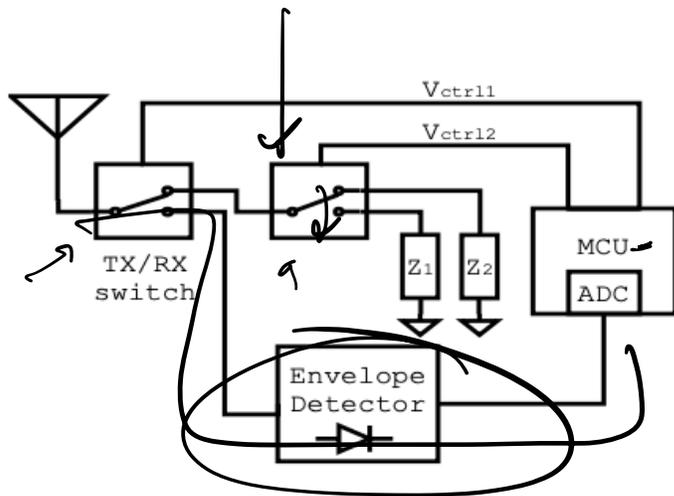

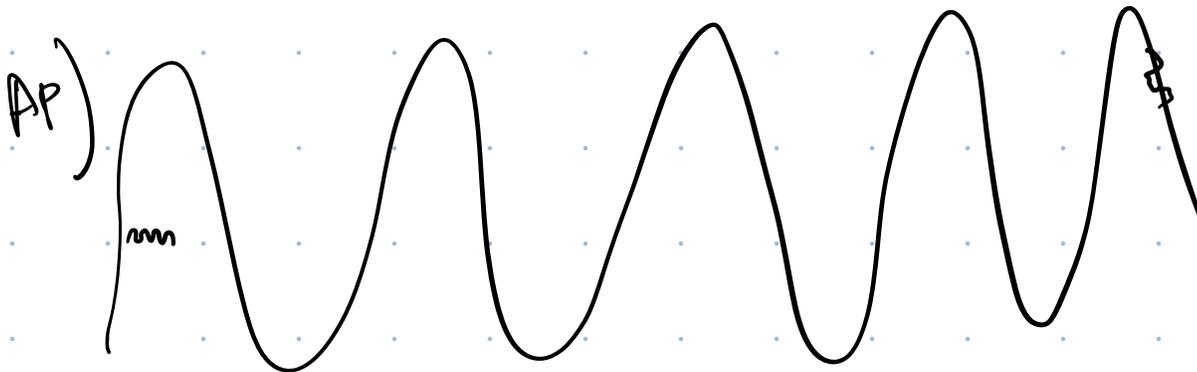

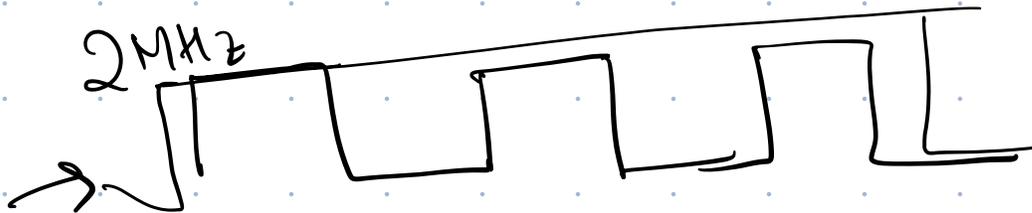

Figure 8: Backscatter hardware including a block diagram (left) and light-weight hardware implementation (right).

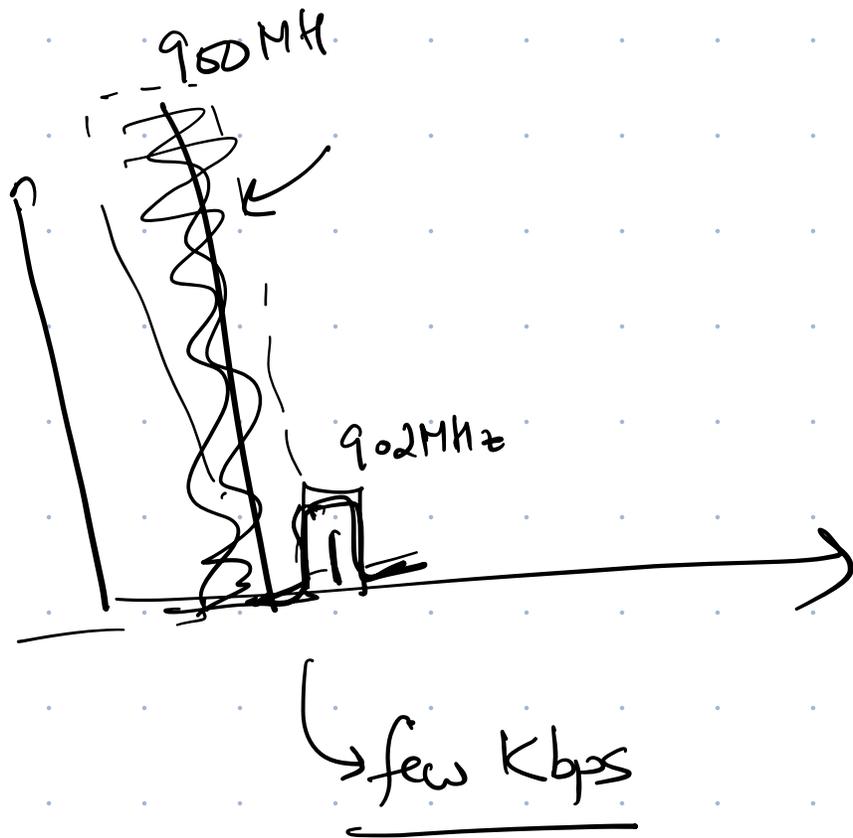

Shift-freq. of reflection by 2MHz.

Microcontroller: 8MHz.

Reflected
signal

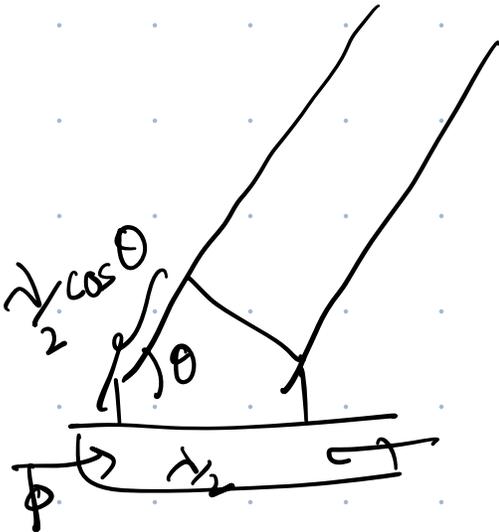

Localization

GPS? → power
→ heavy

RF-based localization.

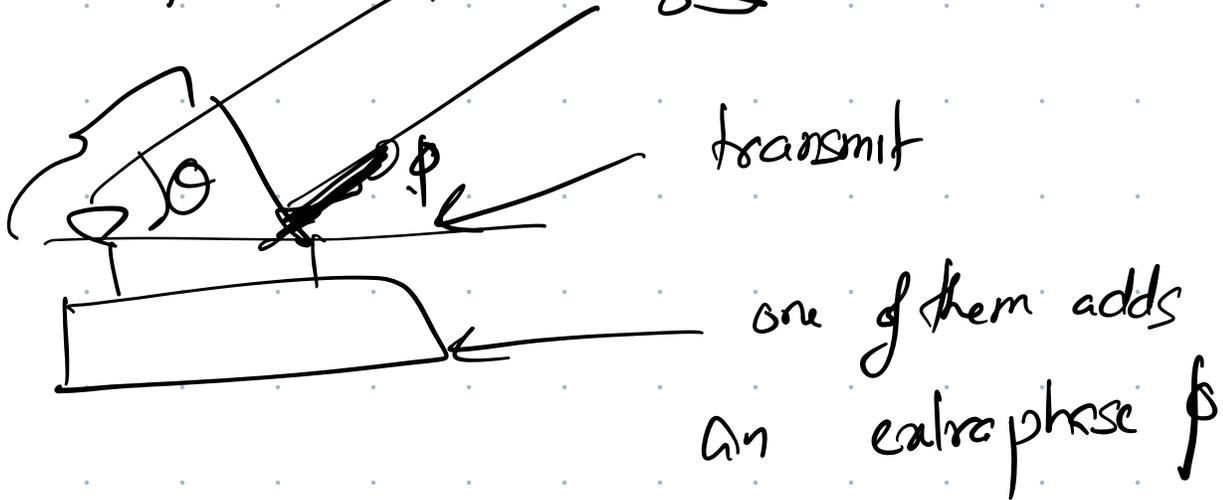

Antenna array to get angle?

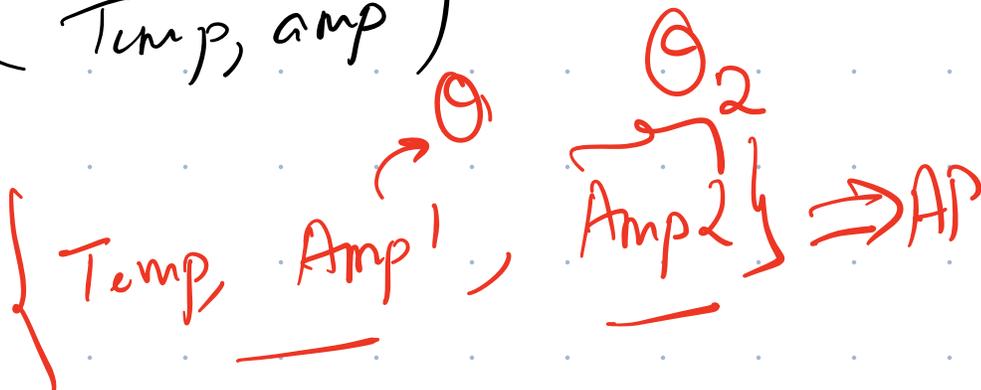

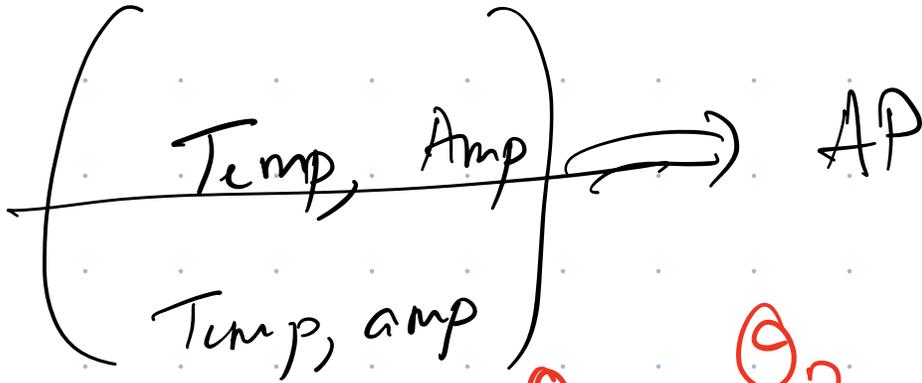

$$\frac{\lambda}{2} \cos \theta$$
$$\lambda \cos \theta$$
$$\lambda \cos \theta$$

AP

precompensate for the extra-phase.

when $\phi = \pi \cos \theta$, the rx signal at the bee is high.

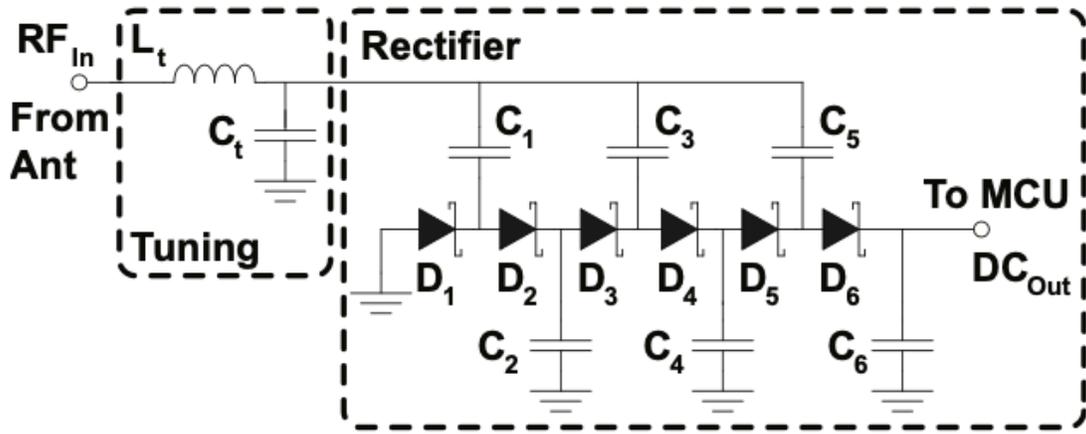

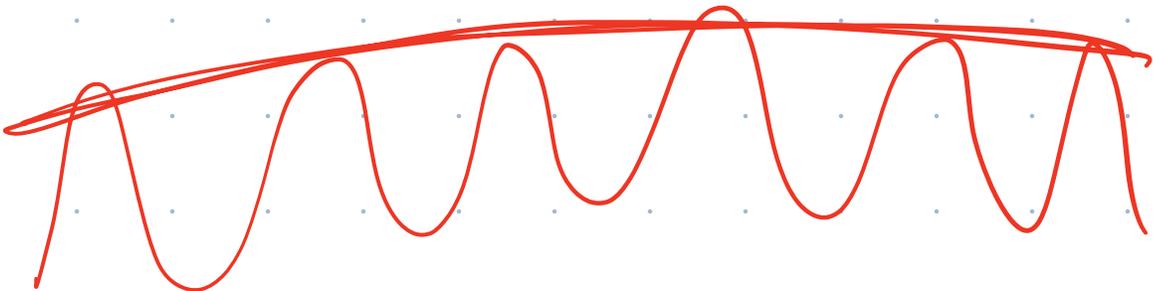

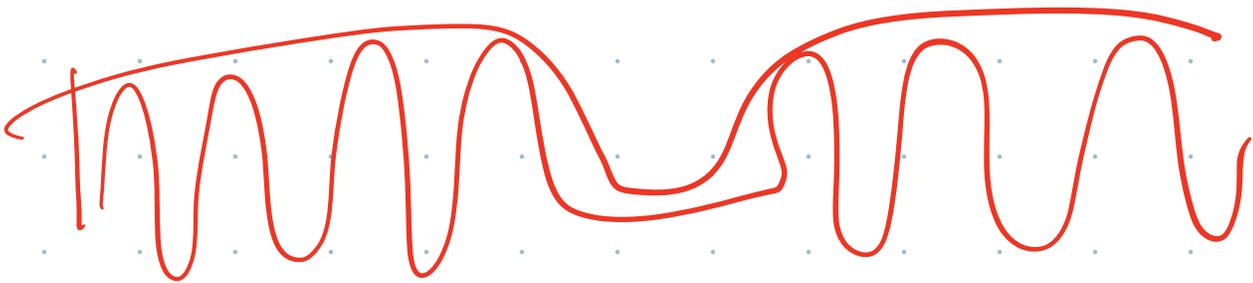

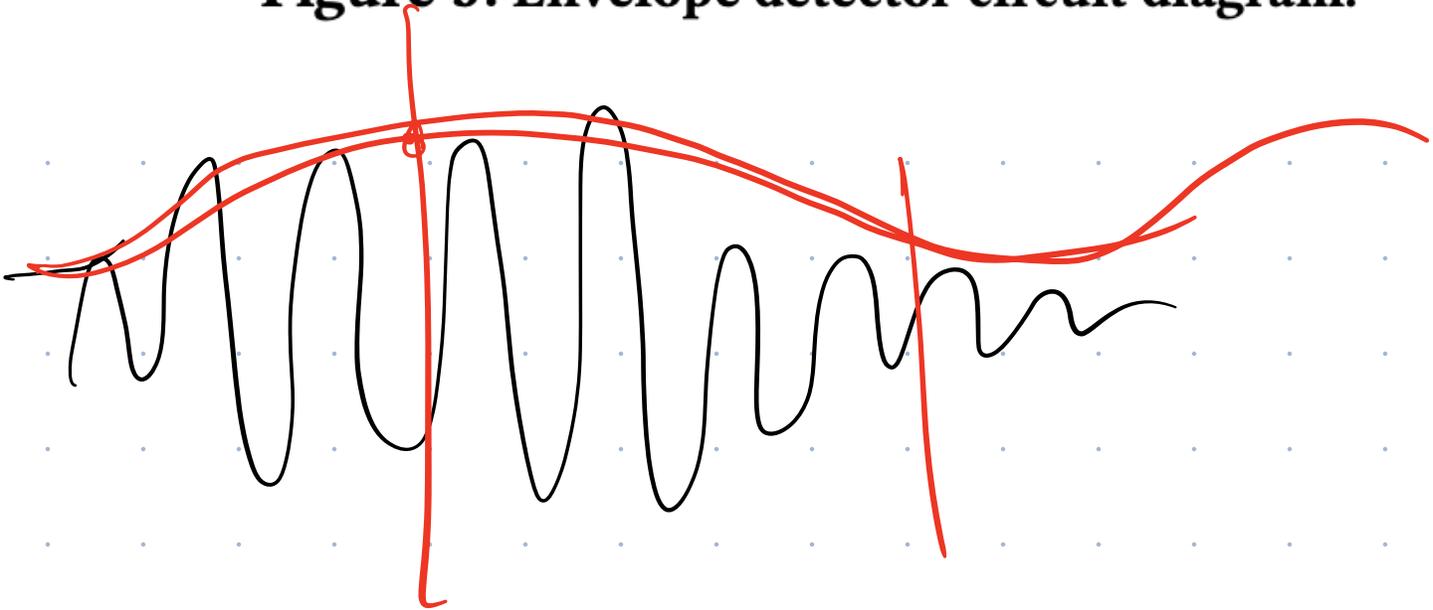

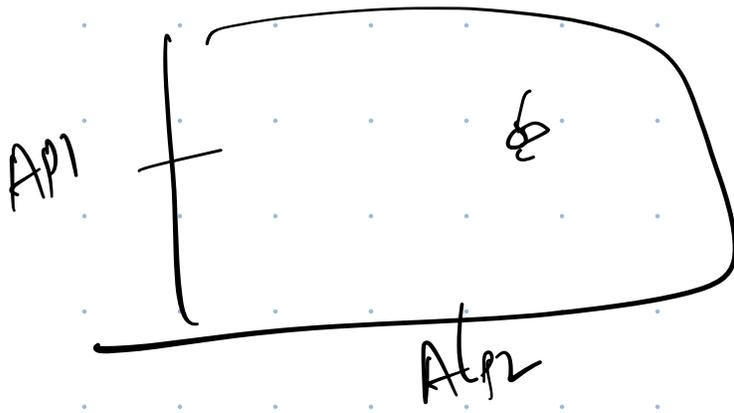

Figure 5: Envelope detector circuit diagram.

Evaluation

$(10^{-5} \text{ } 10^{-4})$

10^{-2}

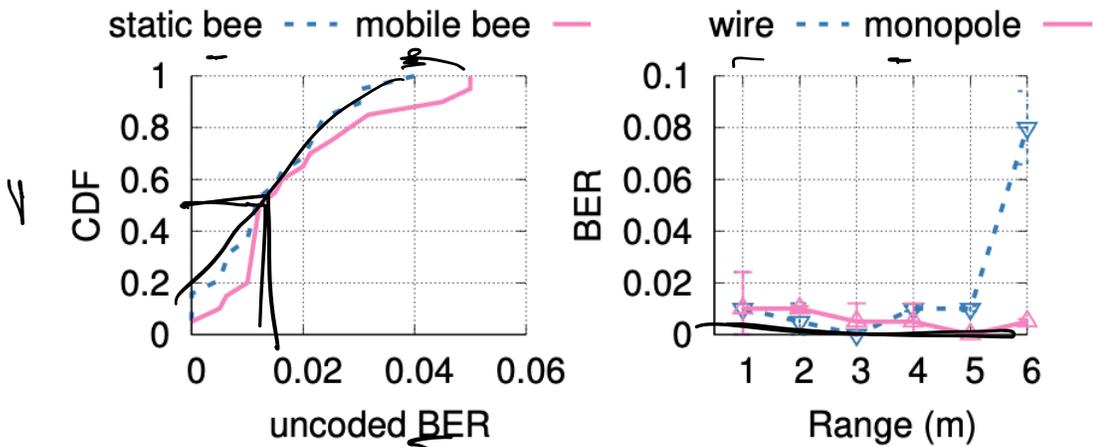

Figure 14: Backscatter performance. The uncoded BER is low and comparable to prior backscatter designs [77] and the bee can upload data when it is back at the hive.

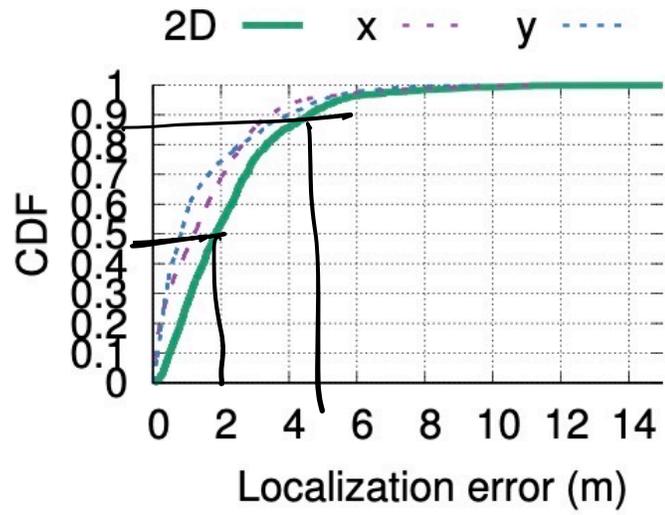

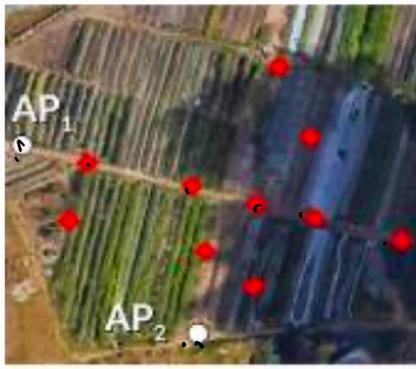

Figure 11: 2D accuracy with deployment in farm.

Limitations

- Datasah
- hard to recharge the bees
 - ↳ Solar power.
 - ↳ RF harvesting
- No control.
- Sensors are small & low fidelity
- Assume hive.
- e-waste / effort waste
- Impact ^{on} of bees & hives.
