**University of Illinois** Fall 2011

# ECE 313: Hour Exam II

1. (a) $\mathbb{T}$ is an exponential distribution with mean 30 minutes. So $f_{\mathbb{T}}(u) = \frac{1}{30}e^{-\frac{u}{30}}, \quad u \geq 0,$ where $u$ is measured in minutes.

   (b) Due to the memoryless property of exponential distributions, the waiting time also has an exponential distribution with mean 30 minutes.

2. (a)

$$\begin{aligned} \mathsf{E}[\mathbb{X}] &= \int_{-\infty}^{\infty} u f_{\mathbb{X}}(u)\, du \\ &= 0 \end{aligned}$$

   since the function $u \cdot f_{\mathbb{X}}(u)$ is an odd function around the origin.

   (b)

$$\mathsf{E}[\mathbb{Y}] = 2\mathsf{E}[\mathbb{X}] + 10 = 10.$$

   The variance $\mathsf{var}[\mathbb{Y}] = 4\mathsf{var}[\mathbb{X}] = 400.$

   (c)

$$\mathsf{E}[\mathbb{Z}] = \mathsf{E}[\mathbb{X}^2] = \mathsf{var}[\mathbb{X}] + (\mathsf{E}[\mathbb{X}])^2 = 100.$$

   (d)

The statement is false. Intuitively, since $\mathbb{W}$ has "smaller" range than $\mathbb{X}$, its variance must be smaller than the variance of $\mathbb{X}$: the probability masses are less spread out and so the moment of inertia must be smaller. A more long-winded explanation is that $\mathsf{E}[\mathbb{W}] > 0$ and since $\mathsf{var}(\mathbb{X}) = \mathsf{E}[\mathbb{X}^2]$, we have that

$$\mathsf{var}(\mathbb{W}) = \mathsf{E}[\mathbb{W}^2] - (\mathsf{E}[\mathbb{W}])^2 = \mathsf{E}[\mathbb{X}^2] - (\mathsf{E}[\mathbb{W}])^2 = \mathsf{var}(\mathbb{X}) - (\mathsf{E}[\mathbb{W}])^2 < \mathsf{var}(\mathbb{X}).$$

3. (a) Since $\int_{-1}^{1} f_1(u)\, du = 1$, we see that $C = 1$.

   (b) The ML decision region $\Gamma_0$ is the set of all $u$ such that $f_0(u) > f_1(u)$. This happens whenever $1 \geq |u| > 0.5$.

4. The pdf of $\mathbb{X}$ is $f_{\mathbb{X}}(u) = 0.5$ whenever $|u| \leq 1$ and 0 otherwise. Now $\mathbb{Y}$ has support over $[0, 1]$. For any $v \in [0, 1]$, the CDF of $\mathbb{Y}$

$$F_{\mathbb{Y}}(v) = P\{\mathbb{Y} \leq v\} = P\{-\sqrt{v} \leq \mathbb{Y} \leq \sqrt{v}\} = \frac{2\sqrt{v}}{2} = \sqrt{v}.$$

Further the CDF $F_{\mathbb{Y}}(v) = 0$ for any $v \leq 0$ and $F_{\mathbb{Y}}(v) = 1$ for any $v \geq 1$. Thus the pdf of $\mathbb{Y}$ is

$$f_{\mathbb{Y}}(v) = \frac{d}{dv} F_{\mathbb{Y}}(v) = \frac{1}{2\sqrt{v}}$$

for any $v \in [0, 1]$ and zero otherwise.

5. (a) Since Gaussian distribution is symmetric with respect to the mean 10, $P\{X > 10\} = 0.5$.
   (b)

$$\begin{aligned} P\{X \geq 12\} &= P\left\{\frac{X-10}{2} \geq 1\right\} \\ &= Q(1) = 0.1587 \end{aligned}$$

6. (a) The joint pdf $f_{X,Y}(u,v)$ is simply inversely proportional to the shaded area $\frac{1}{A} = (c+2)(c+1) - \frac{c(c+1)}{2} = \frac{(c+1)(c+4)}{2} = \frac{c^2+5c+4}{2}$.
   (b) A condition for independence of two random variables is that the support of their joint pdf has to be a product set, and this condition is sufficient for independence if the random variables are jointly uniform. Therefore, $c$ must be such that the shaded area is a rectangle. $\boxed{c = 0}$

## 6.3 Normal tables

Tables 6.1 and 6.2 below were computed using Abramowitz and Stegun, *Handbook of Mathematical Functions*, Formula 7.1.26, which has maximum error at most $1.5 \times 10^{-7}$.

Table 6.1: $\Phi$ function, the area under the standard normal pdf to the left of $x$.
