SOHCAHTOA			

Sine and Cosine functions were invented to describe the sides of a right triangle:

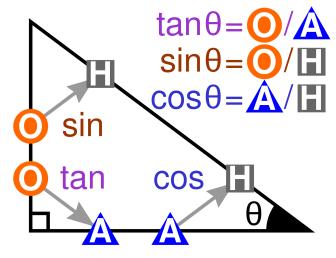

$$\sin \theta = \frac{\text{Opposite}}{\text{Hypotenuse}}$$
$$\cos \theta = \frac{\text{Adjacent}}{\text{Hypotenuse}}$$
$$\tan \theta = \frac{\text{Opposite}}{\text{Adjacent}}$$

Sines. Cosines. and	(ircles		

Imagine an ant walking counter-clockwise around a circle of radius A. Suppose the ant walks all the way around the circle once every T seconds.

• The ant's horizontal position at time t, x(t), is given by

$$x(t) = A\cos\left(\frac{2\pi t}{T}\right)$$

• The ant's vertical position, y(t), is given by

$$y(t) = A\sin\left(\frac{2\pi t}{T}\right)$$

Period and Frequency

The period of a cosine, T, is the time required for one complete cycle. The frequency, f = 1/T, is the number of cycles per second. This picture shows

$$y(t) = A \sin\left(\frac{2\pi t}{T}\right) = A \sin\left(2\pi ft\right)$$

Cosines	Beating	Phasors	Summary
000000000000	000000	0000000000000	00
Pure Tones			

In music or audiometry, a "pure tone" at frequency f is an acoustic signal, p(t), given by

$$p(t) = A\cos\left(2\pi ft + \theta\right)$$

for any amplitude A and phase θ .

Phase, Distance, a	nd Time		

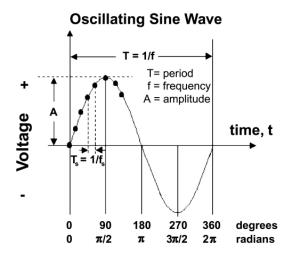

Remember the ant on the circle. The circle has a radius of A (say, A centimeters).

• When the ant has walked a distance of A centimeters around the outside of the circle, then it has moved to an angle of 1 radian.

• When the ant walks all the way around the circle, it has walked $2\pi A$ centimeters, which is 2π radians.

Phase Shift			

Where did the ant start?

 If the ant starts at an angle of θ, and continues walking counter-clockwise at f cycles/second, then

$$x(t) = A\cos\left(\frac{2\pi t}{T} + \theta\right)$$

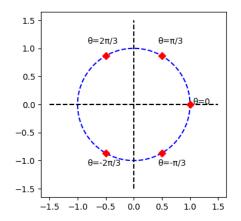

• This is exactly the same as if it started walking from phase 0 at time $-\tau = -\frac{\theta}{2\pi f}$:

$$x(t) = A\cos\left(rac{2\pi}{T}(t+ au)
ight), \quad au = rac{T heta}{2\pi} = rac{ heta}{2\pi f}$$

Cosines	Beating	Phasors	Summary
000000000000	000000	0000000000000	00
Beat tones			

When two pure tones at similar frequencies are added together, you hear the two tones <u>"beating" against each other</u>.

Beat tones demo

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Beat tones can be explained using this trigonometric identity:

$$\cos(a)\cos(b) = \frac{1}{2}\cos(a+b) + \frac{1}{2}\cos(a-b)$$

Let's do the following variable substitution:

$$a + b = 2\pi f_1 t$$
$$a - b = 2\pi f_2 t$$
$$a = 2\pi f_{ave} t$$
$$b = 2\pi f_{beat} t$$

where $f_{ave} = \frac{f_1 + f_2}{2}$, and $f_{beat} = \frac{f_1 - f_2}{2}$.

Beat tones and ⁻	Trigonometri	r identities	
Cosines	Beating	Phasors	Summary
000000000000	○○○●○○	0000000000000	00

Re-writing the trigonometric identity, we get:

$$\frac{1}{2}\cos(2\pi f_1 t) + \frac{1}{2}\cos(2\pi f_2 t) = \cos(2\pi f_{beat} t)\cos(2\pi f_{ave} t)$$

So when we play two tones together, $f_1 = 110$ Hz and $f_2 = 104$ Hz, it sounds like we're playing a single tone at $f_{ave} = 107$ Hz, multiplied by a beat frequency $f_{beat} = 3$ (double beats)/second.

Cosines	Beating	Phasors	Summary
0000000000000	○0000●	0000000000000	00

What happens if we add together, say, three tones?

$$\cos(2\pi 107t) + \cos(2\pi 110t) + \cos(2\pi 104t) = ???$$

For this, and other more complicated operations, it is much, much easier to work with complex exponentials, instead of cosines.

Fuler's Identity			

Euler asked: "What is $e^{j\theta}$?" He used the exponential summation:

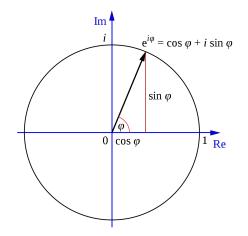

$$e^{x} = 1 + x + \frac{1}{2}x^{2} + \dots + \frac{1}{n!}x^{n} + \dots$$

to show that

$$e^{j heta} = \cos heta + j\sin heta$$

Complex conju	igates		

The polar form of a complex number is $z = re^{j\theta}$,

$$z = re^{j\theta} = r\cos\theta + jr\sin\theta$$

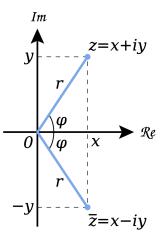

The complex conjugate is defined to be the mirror image of z, mirrored through the real axis:

$$z^* = re^{-j\theta} = r\cos\theta - jr\sin\theta$$

Real part of a complex number

If we know z and z^* ,

$$z = re^{j\theta} = r\cos\theta + jr\sin\theta$$
$$z^* = re^{-j\theta} = r\cos\theta - jr\sin\theta$$

Then we can get the real part of z back again as

$$\Re\left\{z\right\}=\frac{1}{2}\left(z+z^*\right)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Suppose we want to add together a lot of phase shifted, scaled cosines, all at the same frequency:

$$x(t) = A\cos(2\pi ft + \theta) + B\cos(2\pi ft + \phi) + C\cos(2\pi ft + \psi)$$

What is $x(t)$?

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

We can simplify this problem by finding the **phasor representation** of the tones (I'll give you a formal definition of "phasor" in a few slides):

$$A\cos(2\pi ft + \theta) = \Re \left\{ Ae^{j\theta} e^{j2\pi ft} \right\}$$
$$B\cos(2\pi ft + \phi) = \Re \left\{ Be^{j\phi} e^{j2\pi ft} \right\}$$
$$C\cos(2\pi ft + \psi) = \Re \left\{ Ce^{j\theta} e^{j2\psi ft} \right\}$$

So

$$x(t) = \Re \left\{ \left(A e^{j heta} + B e^{j \phi} + C e^{j \psi}
ight) e^{j 2 \pi f t}
ight\}$$

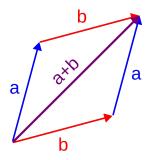

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Why complex exponentials are better than cosines

We add complex numbers by (1) adding their real parts, and (2) adding their imaginary parts:

$$Ae^{j\theta} + Be^{j\phi} + Ce^{j\psi} = (A\cos\theta + B\cos\phi + C\cos\psi) + j(A\sin\theta + B\sin\phi + C\sin\psi)$$

Cosines	Beating	Phasors	Summary
000000000000	000000	00000000000000	00

Adding phasors

by Gonfer, CC-SA 3.0, https://commons.wikimedia.org/wiki/File:Sumafasores.gif

Suppose we want to add together a lot of phase shifted, scaled cosines, all at the same frequency:

$$X(t) = A\cos(2\pi ft + \theta) + B\cos(2\pi ft + \phi) + C\cos(2\pi ft + \psi)$$

Here's the fastest way to do that:

- Convert all the tones to their phasors, $a = Ae^{j\theta}$, $b = Be^{j\phi}$, and $c = Ce^{j\psi}$.
- 2 Add the phasors: x = a + b + c.
- Take the real part:

$$x(t) = \Re\left\{xe^{j2\pi ft}\right\}$$

Beating 00000 Phasors 0000000000000000

Summary 00

BTW, What is a "phaser"?

By McFadden, Strauss Eddy & Irwin for Desilu Productions, public domain image 1966,

https://commons.wikimedia.org/wiki/File:William_Shatner_Sally_Kellerman_Star_Trek_1966.JPG

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ 三臣 - ∽ � � �

Wikipedia has the following definition, which is the best I've ever seen:

- The function $Ae^{j(\omega t+\theta)}$ is called the **analytic representation** of $A\cos(\omega t+\theta)$.
- It is sometimes convenient to refer to the entire function as a **phasor**. But the term **phasor** usually implies just the static vector $Ae^{j\theta}$.

In other words, the "phasor" can mean either $Ae^{j(\omega t+\theta)}$ or just $Ae^{j\theta}$. If you're asked for the phasor representation of some cosine, either answer is correct.

Some phasor demos from the textbook

Here are some phasor demos, provided with the textbook.

- One rotating phasor demo: This shows how the cosine, $cos(2\pi ft + \theta)$, is the real part of the phasor $e^{j(2\pi ft + \theta)}$.
- **Positive and Negative Frequency Phasors**: This shows how you can get the real part of a phasor by adding its complex conjugate (its "negative frequency phasor"):

$$\cos(2\pi ft+\theta)=\frac{1}{2}e^{j(2\pi ft+\theta)}+\frac{1}{2}e^{-j(2\pi ft+\theta)}$$
